Pluriharmonic Symbols of Commuting Toeplitz Operators

BOO RIM CHOE AND YOUNG JOO LEE

Abstract. It has been recently shown by Axler and Čučković that two Toeplitz operators on the Bergman space of the unit disk with harmonic symbols commute only in the obvious case. In this paper we consider the corresponding problem with pluriharmonic symbols on the ball.

1. Introduction and Results

Our setting throughout the paper is the unit ball $B_n$ of the complex $n$-space $\mathbb{C}^n$; dimension $n$ is fixed and thus we usually write $B = B_n$ unless otherwise specified. The Bergman space $A^2(B)$ is the closed subspace of $L^2(B) = L^2(B, V)$ consisting of holomorphic functions where $V$ denotes the volume measure on $B$ normalized to have total mass 1. For $u \in L^\infty(B)$, the Toeplitz operator $T_u$ with symbol $u$ is the bounded linear operator on $A^2(B)$ defined by $T_u(f) = P(uf)$ where $P$ denotes the orthogonal projection of $L^2(B)$ onto $A^2(B)$. The projection $P$ is the well-known Bergman projection which can be explicitly written as follows:

$$P(\psi)(z) = \int_B \frac{\psi(w)}{(1 - \langle z, w \rangle)^{n+1}} dV(w) \quad (z \in B)$$

for functions $\psi \in L^2(B)$. Here $\langle , \rangle$ is the ordinary Hermitian inner product on $\mathbb{C}^n$. See [4, Chapters 3 and 7] for more information on the projection $P$.

In one dimensional case, Axler and Čučković [3] has recently obtained a complete description of harmonic symbols of commuting Toeplitz operators: if two Toeplitz operators with harmonic symbols commute, then either both symbols are holomorphic, or both symbols are antiholomorphic, or a nontrivial linear combination of symbols is constant (the converse is also true and trivial). Trying to generalize this characterization to the ball, one may naturally think of pluriharmonic symbols. A function $u \in C^2(B)$ is said to be pluriharmonic if its restriction to an arbitrary complex line that intersects the ball is harmonic as a function of single complex variable. As is well known, a real-valued function on $B$ is pluriharmonic if and only if it is the real part of a holomorphic function on $B$. Hence every pluriharmonic function on $B$ can be expressed, uniquely up to an additive constant, as the sum of a holomorphic function and an antiholomorphic function.

1991 Mathematics Subject Classification. Primary 47B38 Secondary 32A37.
In the present paper we consider the same problem of characterizing pluriharmonic symbols of commuting Toeplitz operators on the ball. Our first result is a necessary condition in terms of $M$-harmonicity (see Section 2 for relevant definitions) for such symbols.

**Theorem 1.** Let $f$, $g$, $h$, and $k$ be holomorphic functions on $B$ such that $f + \bar{g}$ and $h + \bar{k}$ are pluriharmonic symbols of two commuting Toeplitz operators on $A^2(B)$. Then $fk - h\bar{g}$ is $M$-harmonic on $B$.

The proof in [3] shows that the converse of Theorem 1 is also true in one dimensional case. Unfortunately, we were not able to prove or disprove the converse of Theorem 1 on the ball in general. However, Theorem 1 is enough to produce a simple characterization in case one of symbols is holomorphic (or antiholomorphic which amounts to considering adjoint operators). Its proof will make use of a recent characterization (see Proposition 8) of Ahern and Rudin [2] on $M$-harmonic products.

**Theorem 2.** Suppose that $u$ and $v$ are pluriharmonic symbols of two commuting Toeplitz operators on $A^2(B)$. If $u$ is nonconstant and holomorphic, then $v$ must be holomorphic.

Recall that a bounded linear operator on a Hilbert space is called normal if it commutes with its adjoint operator. Since the adjoint operator of the Toeplitz operator with symbol $u$ is the Toeplitz operator with symbol $\bar{u}$, the following is an immediate consequence of Theorem 2 whose proof is therefore omitted.

**Corollary 3.** The Toeplitz operator with holomorphic symbol $u$ is normal on $A^2(B)$ if and only if $u$ is constant. □

In Section 2 we collect some facts about $M$-harmonic functions which are needed in Section 3 where we prove Theorems 1 and 2. In section 4 we conclude the paper with some remarks and discussions related to the converse of Theorem 1 and a possible pluriharmonic version of Corollary 3.

## 2. $M$-Harmonic Functions

For $z, w \in B, z \neq 0$, define

$$\varphi_z(w) = \frac{z - |z|^{-2} < w, z > z - \sqrt{1 - |z|^2}(w - |z|^{-2} < w, z > z)}{1 - < w, z >}$$

and $\varphi_0(w) = -w$. Then $\varphi_z \in M$, the group of all automorphisms (=biholomorphic self-maps) of $B$. Furthermore, each $\varphi \in M$ has a unique representation $\varphi = U \circ \varphi_z$ for some $z \in B$ and unitary operator $U$ on $\mathbb{C}^n$. For $u \in C^2(B)$ and $z \in B$, we define

$$(\tilde{\Delta}u)(z) = \Delta(u \circ \varphi_z)(0)$$

where $\Delta$ denotes the ordinary Laplacian. The operator $\tilde{\Delta}$ is called the invariant Laplacian because it commutes with automorphisms of $B$ in the sense that $\tilde{\Delta}(u \circ \varphi) = (\tilde{\Delta}u) \circ \varphi$ for $\varphi \in M$. We say that a function $u \in C^2(B)$ is $M$-harmonic on $B$ if it is annihilated on
By \( \tilde{\Delta} \). One can easily see that \( \mathcal{M} \)-harmonic functions are precisely harmonic ones in one dimensional case. As is the case for harmonic functions, \( \mathcal{M} \)-harmonic functions are characterized by a certain mean value property (see [7, Chapter 4]): a function \( u \in C(B) \) is \( \mathcal{M} \)-harmonic on \( B \) if and only if

\[
    (u \circ \varphi)(0) = \int_S (u \circ \varphi)(r\zeta) \, d\sigma(\zeta) \quad (0 \leq r < 1)
\]

for every \( \varphi \in \mathcal{M} \). Here \( \sigma \) denotes the rotation invariant probability measure on the unit sphere \( S \), the boundary of \( B \). This is the so-called invariant mean value property. The following area version of this invariant mean value property also gives a characterization of \( \mathcal{M} \)-harmonicity of functions continuous up to the boundary (see [7, Proposition 13.4.4]): a function \( u \in C(\bar{B}) \) is \( \mathcal{M} \)-harmonic on \( B \) if and only if

\[
    (u \circ \varphi)(0) = \int_B (u \circ \varphi) \, dV
\]

for every \( \varphi \in \mathcal{M} \).

The key step to our proof of Theorem 1 is adapted from that of [3]. That is, we will use a slight variant of the characterization of \( \mathcal{M} \)-harmonicity given by the area version of invariant mean value property. To state it, let us introduce some notations. We associate with each \( v \in C(B) \) its so-called radialization \( A(v) \) defined by the formula

\[
    A(v)(z) = \int_{\mathcal{U}} (v \circ U)(z) \, dU \quad (z \in B)
\]

where \( dU \) denotes the Haar measure on the group \( \mathcal{U} \) of all unitary operators on \( \mathbb{C}^n \). Using Proposition 1.4.7 of [7], one can easily verify that

\[
    A(v)(z) = \int_S v(|z|\zeta) \, d\sigma(\zeta) \quad (z \in B)
\]

and hence \( A(v) \) is indeed a radial function on \( B \). We write \( A(v) \in C(\bar{B}) \) if \( A(v) \) has a continuous extension up to the boundary.

Proposition 4. Suppose that \( u \in C(B) \cap L^1(B) \). Then \( u \) is \( \mathcal{M} \)-harmonic on \( B \) if and only if

\[
    \int_B (u \circ \varphi) \, dV = (u \circ \varphi)(0)
\]

and

\[
    A(u \circ \varphi) \in C(\bar{B})
\]
for every $\varphi \in \mathcal{M}$.

**Proof.** We first prove the easy direction. Suppose that $u$ is $\mathcal{M}$-harmonic on $B$. Let $\varphi \in \mathcal{M}$. By the invariant mean value property, we have

$$(u \circ \varphi)(0) = \int_S (u \circ \varphi)(r\zeta) \, d\sigma(\zeta)$$

for every $r \in [0,1)$. Integrating in polar coordinates, we have (1). The above also shows that $\mathcal{A}(u \circ \varphi)$ is constant on $B$, with value $(u \circ \varphi)(0)$, and therefore (2) holds.

To prove the other direction (which we need for the proof of Theorem 1), suppose that (1) and (2) hold. Let $\varphi \in \mathcal{M}$ and put $v = \mathcal{A}(u \circ \varphi)$. We first show that $v$ is $\mathcal{M}$-harmonic on $B$. Since $v \in C(\overline{B})$ by (2), it is sufficient to show the area version of invariant mean value property of $v$. To do this, fix $\psi \in \mathcal{M}$.

\begin{equation}
\tag{3}
\int_B (v \circ \psi) \, dV = \int_B \int_{\mathcal{U}} (u \circ F_U)(z) \, dU \, dV(z)
\end{equation}

where $F_U = \varphi \circ U \circ \psi \in \mathcal{M}$.

For a fixed unitary operator $U$ on $\mathbb{C}^n$, consider the inverse mapping $G_U \in \mathcal{M}$ of $F_U$ and put $a = F_U(0) = (\varphi \circ U \circ \psi)(0)$. Then, since $|\varphi^{-1}(0)| = |\varphi(0)|$, we have ([7, Theorem 2.2.5])

$$1 - |a|^2 = \frac{(1 - |\varphi(0)|^2)(1 - |\psi(0)|^2)}{1 - |\varphi^{-1}(0), (U \circ \psi)(0) > |^2} \geq (1 - |\varphi(0)|^2)(1 - |\psi(0)|^2).$$

On the other hand, we have ([7, Theorem 2.2.6])

$$J_R G_U(w) = \left(\frac{1 - |a|^2}{1 - |w, a > |^2}\right)^{n+1} \leq \left(\frac{4}{1 - |a|^2}\right)^{n+1} \quad (w \in B)$$

where $J_R G_U(w)$ denotes the real Jacobian of $G_U$ at $w \in B$. It follows that the function $J_R G_U$ is bounded on $B$ uniformly in $U$. Therefore, since $u \in L^1(B)$ by assumption, a change of variables shows that

$$\int_{\mathcal{U}} \int_B |u \circ F_U| \, dV \, dU = \int_{\mathcal{U}} \int_B |u| J_R G_U \, dV \, dU < \infty.$$

Now one can interchange the order of integrations on the right side of (3) to obtain

$$\int_B (v \circ \psi) \, dV = \int_{\mathcal{U}} \int_B (u \circ F_U) \, dV \, dU$$

$$= \int_{\mathcal{U}} (u \circ F_U)(0) \, dU$$

$$= \int_{\mathcal{U}} (u \circ \varphi \circ U)(\psi(0)) \, dU$$

$$= \mathcal{A}(u \circ \varphi)(\psi(0))$$

$$= (v \circ \psi)(0)$$
where the second equality holds by (1). Hence \( v \) is \( \mathcal{M} \)-harmonic on \( B \). Since \( v \) is radial, the invariant mean value property shows that \( v \) is constant. Consequently,

\[
(u \circ \varphi)(0) = v(0) = v(z) = \int_S (u \circ \varphi)(|z|\zeta)d\sigma(\zeta) \quad (z \in B).
\]

Since \( \varphi \in \mathcal{M} \) is arbitrary, the above shows that \( u \) has the invariant mean value property and hence that \( u \) is \( \mathcal{M} \)-harmonic on \( B \) as desired. □

3. Proofs

First, we recall some well known facts on the Hardy space \( H^2(B) \) consisting of holomorphic functions \( f \) on \( B \) for which

\[
\sup_{0 < r < 1} \int_S |f(r\zeta)|^2 d\sigma(\zeta) < \infty.
\]

Note that \( H^2(B) \subset A^2(B) \) by an integration in polar coordinates. To each \( f \in H^2(B) \) corresponds its boundary function \( f^* \) on \( S \) defined by \( f^*(\zeta) = \lim_{r \to 1} f(r\zeta) \) for \( \sigma \)-almost every \( \zeta \in S \). In addition, we have \( f^* \in L^2(\sigma) \) and

\[
\lim_{r \to 1} \int_S |f(r\zeta) - f^*(\zeta)|^2 d\sigma(\zeta) = 0.
\]

See [7, Chapter 5] for details. One can easily verify by using the above that if \( f, g \in H^2(B) \), then

\[
\lim_{r \to 1} \int_S f(r\zeta)\bar{g}(r\zeta) d\sigma(\zeta) = \int_S f^* \bar{g}^* d\sigma
\]

and hence \( A(fg) \in C(\bar{B}) \).

Next, before turning to the proof of Theorem 1, we prove a couple of lemmas. For \( \varphi \in \mathcal{M} \), let \( U_\varphi \) denote the linear operator on \( A^2(B) \) defined by \( U_\varphi f = (f \circ \varphi)J_\varphi \) where \( J_\varphi \) is the complex Jacobian of \( \varphi \) and write \( U_\varphi^* \) for its adjoint operator.

**Lemma 5.** Let \( \varphi \in \mathcal{M} \). Then \( U_\varphi U_\varphi^* = U_\varphi^* U_\varphi \) is the identity operator on \( A^2(B) \).

In other words, the conclusion of the lemma is that \( U_\varphi \) is unitary on \( A^2(B) \).

**Proof.** Since \(|J_\varphi|^2\) is the real Jacobian of \( \varphi \), a change of variables yields

\[
\int_B |(f \circ \varphi)|^2 |J_\varphi|^2 dV = \int_B |f|^2 dV
\]

for every \( f \in A^2(B) \), and hence \( U_\varphi \) is an isometry of \( A^2(B) \) into \( A^2(B) \). Clearly \( U_\varphi^{-1} \) is the inverse operator for \( U_\varphi \). An invertible linear isometry on a Hilbert space is a unitary operator (see for example [5, Theorem 12.13]). The proof is complete. □
Lemma 6. Let \( \varphi \in \mathcal{M} \) and let \( u \in L^\infty(B) \). Then

\[ U_\varphi T_u U_\varphi^* = T_{u \circ \varphi}. \]

Recall that \( P \) denotes the Bergman projection of \( L^2(B) \) onto \( A^2(B) \).

Proof. Define \( V_\varphi : L^2(B) \rightarrow L^2(B) \) by \( V_\varphi f = (f \circ \varphi) J \varphi \). As in the proof of Lemma 5, \( V_\varphi \) is unitary on \( L^2(B) \). Since \( V_\varphi = U_\varphi \) when restricted to \( A^2(B) \), we see that \( V_\varphi \) takes \( A^2(B) \) onto \( A^2(B) \) and hence

\[ PV_\varphi = V_\varphi P. \]

If \( f \in A^2(B) \), then we see from (4) that

\[ T_{u \circ \varphi} U_f = T_{u \circ \varphi} ((f \circ h) J \varphi) = P((u \circ \varphi)(f \circ \varphi) J \varphi) = P(V_\varphi uf) = V_\varphi (P uf) = U_\varphi T_u f. \]

Thus \( T_{u \circ \varphi} U_f = U_\varphi T_u \), and since \( U_\varphi \) is unitary by Lemma 5, we have \( T_{u \circ \varphi} = U_\varphi T_u U_\varphi^* \). The proof is complete. \( \square \)

We are now ready to prove Theorem 1.

Proof of Theorem 1. Let \( u = f + \bar{g} \) and \( v = h + \bar{k} \). Since \( u \) and \( v \) are bounded on \( B \), functions \( f, g, h, \) and \( k \) must be in \( H^2(B) \) by an application of the Korányi-Vagi theorem (see [4, Theorem 6.3.1]). In particular, functions \( f, g, h, \) and \( k \) are all in \( A^2(B) \). Let 1 denote the constant function 1 on \( B \). Then we have

\[ T_u T_v 1 = T_u (P v) = T_u (h + \bar{k}(0)) = P (f h + \bar{k}(0) f + h \bar{g} + \bar{g}(0) \bar{k}(0)). \]

Note that \( \int_B F dV = F(0) \) for holomorphic functions \( F \in L^1(B) \). Since the projection \( P \) is orthogonal, it follows that

\[ \int_B T_u T_v 1 dV = \int_B f h + \bar{k}(0) f + h \bar{g} + \bar{g}(0) \bar{k}(0) dV \]

\[ = f(0) h(0) + f(0) \bar{k}(0) + \bar{g}(0) \bar{k}(0) + \int_B h \bar{g} dV. \]

Similarly,

\[ \int_B T_v T_u 1 dV = f(0) h(0) + h(0) \bar{g}(0) + \bar{g}(0) \bar{k}(0) + \int_B f \bar{k} dV. \]

Since \( T_u T_v = T_v T_u \) by assumption, letting \( \alpha = f \bar{k} - h \bar{g} \), we have by (5) and (6) that

\[ \int_B \alpha dV = \alpha(0). \]
We also have (by a remark mentioned at the beginning of this section) that
\[ A(\alpha) \in C(\bar{B}). \] 

Let \( \varphi \in \mathcal{M} \). Multiplying both sides of the equation \( T_u T_v = T_v T_u \) by \( U_\varphi \) on the left and by \( U_\varphi^* \) on the right, we obtain by Lemma 5 that
\[ U_\varphi T_u U_\varphi^* U_\varphi T_v U_\varphi^* = U_\varphi T_v U_\varphi^* U_\varphi T_u U_\varphi^* \]
and therefore by Lemma 6
\[ (9) \quad T_{u \circ \varphi} T_{v \circ \varphi} = T_{v \circ \varphi} T_{u \circ \varphi}. \]
Equations (7) and (8) were derived under the assumption that \( T_u T_v = T_v T_u \). Thus (9) says that (7) and (8) remain valid with \( \alpha \circ \varphi \) in place of \( \alpha \). That is,
\[ \int_B (\alpha \circ \varphi) \, dV = (\alpha \circ \varphi)(0) \]
and \( A(\alpha \circ \varphi) \in C(\bar{B}) \) for any \( \varphi \in \mathcal{M} \). It follows from Proposition 4 that \( \alpha \) is \( \mathcal{M} \)-harmonic on \( B \). This completes the proof. \( \square \)

Having proved Theorem 1, we now turn to the proof of Theorem 2 which states that if one of symbols of two commuting Toeplitz operators is nonconstant and holomorphic, then the other one must be also holomorphic. In the proof we apply a consequence of the following recent theorem of Ahern and Rudin [2] on \( \mathcal{M} \)-harmonic products.

**Proposition 8.** Let \( f \) and \( g \) be holomorphic functions such that \( f \bar{g} \) is \( \mathcal{M} \)-harmonic on \( B \).

(a) If \( n \leq 2 \), then either \( f \) or \( g \) is constant.
(b) If \( n \geq 3 \), and if both \( f \) and \( g \) are nonconstant, then there exist an integer \( 2 \leq m \leq n - 1 \), a unitary operator \( U \) on \( \mathbb{C}^n \), and entire functions \( F \) on \( \mathbb{C}^{m-1} \), and \( G \) on \( \mathbb{C}^{n-m} \), such that
\[
    f(Uz) = F(\frac{z_2}{1 - z_1}, \ldots, \frac{z_m}{1 - z_1}), \quad g(Uz) = G(\frac{z_{m+1}}{1 - z_1}, \ldots, \frac{z_n}{1 - z_1}).
\]
Moreover, \( f(B) = F(\mathbb{C}^{m-1}) \), \( g(B) = G(\mathbb{C}^{n-m}) \), and \( (f \bar{g})(B) = \mathbb{C} \) or \( \mathbb{C} \setminus \{0\} \).

Combining Proposition 8 with Liouville’s theorem, we have the following:

**Lemma 9.** Let \( f \) and \( g \) be holomorphic functions such that \( f \bar{g} \) is \( \mathcal{M} \)-harmonic on \( B \). If one of them is bounded on \( B \), then either \( f \) or \( g \) is constant. \( \square \)

**Proof of Theorem 2.** Write \( v = h + \bar{k} \) where \( h, k \) are holomorphic on \( B \). Then, by Theorem 1, \( uk \) is \( \mathcal{M} \)-harmonic on \( B \). Since \( u \) is bounded and nonconstant on \( B \) by assumption, we see from Lemma 9 that \( k \) must be constant and hence \( v \) is holomorphic on \( B \). Conversely, since Toeplitz operators with holomorphic symbols are simply multiplication operators, it is straightforward that two Toeplitz operators with holomorphic symbols commute on \( A^2(B) \). \( \square \)
4. Some Related Remarks

Throughout the section, $f$, $g$, $h$, and $k$ denote holomorphic functions on $B$, normalized so that $f(0) = g(0) = h(0) = k(0) = 0$ for simplicity. In view of Theorem 1, one may ask (under additional boundedness hypothesis as in Lemma 9 if desired) whether there is any further description of such functions for which

\[(10) \, \tilde{\Delta}(f\bar{k}) = \tilde{\Delta}(h\bar{g}).\]

Both sides of the above are assumed to be not identically zero; otherwise we are back to Proposition 8. In one dimensional case, it is elementary to verify that condition (10) implies $f = \lambda h$ and $g = \bar{\lambda} k$ for some unimodular constant $\lambda$. In higher dimensional cases, we do not know whether the same is true in general. This question can be rephrased as follows: does it follow from (10) that $f\bar{k} - h\bar{g}$ is pluriharmonic? The answer is known to be yes if an additional smoothness condition of certain order, depending on dimension $n$, is satisfied up to the boundary: if a function $u \in C^n(\bar{B})$ is $M$-harmonic on $B$, then $u$ is pluriharmonic on $B$. See [1] or [4]. We also remark in passing that there is in fact a more precise version of this fact ([6]): if $u$ is $M$-harmonic on $B$ and if the $n$th radial derivative $D^n u$ satisfies the $L^2$-growth condition

\[\left\{ \int_S |(D^n u)(r\zeta)|^2 \, d\sigma(\zeta) \right\}^{1/2} = o\left( \log \frac{1}{1-r} \right) \quad (r \nearrow 1),\]

then $u$ is pluriharmonic on $B$. Note that $T_fT_gT_{h+k} = T_{h+k}T_fT_g$ if and only if $T_fT_k - T_kT_f = T_hT_g - T_gT_h$ for functions $f$, $g$, $h$, and $k$ bounded on $B$. Thus, for example, we have the following:

If $f$, $g$, $h$, and $k$ are of class $C^n$ on $B$, and if $T_fT_k - T_kT_f = T_hT_g - T_gT_h$ on $A^2(B)$, then $f = \lambda h$ and $g = \lambda k$ for some unimodular constant $\lambda$.

Trying to obtain a pluriharmonic version of Corollary 3, one is led to a special case of (10) which may be of some independent interest. That is, the question is now whether the condition

\[(11) \, \tilde{\Delta}|f|^2 = \tilde{\Delta}|g|^2\]

implies $f = \lambda g$ for some unimodular constant $\lambda$. We could prove only in some special cases that the answer is yes. Those are included in the rest of the paper with hope that they may serve as a motivation for someone to settle the question in the affirmative or negative direction. We first prove a couple of lemmas.

**Lemma 10.** Let $\Omega$ be a given connected open subset of $\mathbb{C}^n$. If $F_j$ and $G_j$ ($1 \leq j \leq m$) are holomorphic functions such that $\sum_{j=1}^{m} F_jG_j = 0$ on $\Omega$, then $\sum_{j=1}^{m} F_j(z)\bar{G}_j(w) = 0$ for all $z, w \in \Omega$.

**Proof.** Assume, without loss of generality, that an open ball $\beta$ with center at the origin is contained in $\Omega$. Define

\[H(z, w) = \sum_{j=1}^{m} F_j(z)\bar{G}_j(w) \quad (z, w \in \Omega).\]
It is sufficient to show that $H(z, w) = 0$ for all $z, w \in \beta$ by real analyticity. Let $L$ be the invertible linear operator on $\mathbb{C}^n \times \mathbb{C}^n$ defined by $L(z, w) = (z + iw, z - iw)$. Then, since $H(z, \bar{z}) = 0$ for all $z \in \beta$ by hypothesis, we have $H \circ L = 0$ on $V \cap (\mathbb{R}^n \times \mathbb{R}^n)$ where $V = L^{-1}(\beta \times \beta)$. Note that the function $H \circ L$ is holomorphic on $V$. A consideration of Taylor coefficients therefore shows that $H \circ L$ vanishes on $V$. In other words, $H = 0$ on $\beta \times \beta$, completing the proof. □

**Lemma 11.** Let $\Omega$ be a given connected open subset of $\mathbb{C}^n$. If $F_j$ and $G_j$ ($1 \leq j \leq m$) are holomorphic functions such that $\sum_{j=1}^{m} |F_j|^2 = \sum_{j=1}^{m} |G_j|^2$ on $\Omega$, then there is a unitary operator $U$ on $\mathbb{C}^m$ such that $(F_1, \cdots, F_m) = U \circ (G_1, \cdots, G_m)$ on $\Omega$.

**Proof.** The lemma is trivial if $m = 1$. To proceed by induction on $m$, let $m > 1$ and suppose that the lemma is proved for $m - 1$. Put $F = (F_1, \cdots, F_m)$ and $G = (G_1, \cdots, G_m)$. We may assume that $\Omega$ contains the origin. We may further assume that $|F(0)| = |G(0)| = 1$.

Pick unitary operators $U_1$ and $U_2$ on $\mathbb{C}^m$ such that $U_1(F(0)) = U_2(G(0)) = (1, 0, \cdots, 0)$. Let $U_1 \circ F = (f_1, \cdots, f_m)$ and $U_2 \circ G = (g_1, \cdots, g_m)$. Then we have $\sum_{j=1}^{m} f_j \bar{f}_j = \sum_{j=1}^{m} g_j \bar{g}_j$ on $\Omega$ and hence, by Lemma 10,

$$\sum_{j=1}^{m} f_j(z) \bar{f}_j(w) = \sum_{j=1}^{m} g_j(z) \bar{g}_j(w)$$

for all $z, w \in \Omega$. Taking $w = 0$, we obtain $f_1 = g_1$ on $\Omega$. Thus, by induction hypothesis, there exists some unitary operator $U$ on $\mathbb{C}^{m-1}$ such that $(f_2, \cdots, f_m) = U \circ (g_2, \cdots, g_m)$ on $\Omega$. Now let

$$U_3 = \begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & U \\ 0 & \cdots & 0 & 1 \end{pmatrix}.$$

Then $U_3$ is a unitary operator on $\mathbb{C}^m$ and we have $F = U_1^{-1} \circ U_3 \circ U_2 \circ G$. The proof is complete. □

In what follows, we let $\nabla f = (D_1 f, \cdots, D_n f)$ and $\mathcal{R} f = \sum_{j=1}^{n} z_j D_j f$ where $D_j$ denotes the differentiation with respect to $z_j$-variable. With these notations, equation (11) becomes

$$(12) \quad |\nabla f|^2 + |\mathcal{R} g|^2 = |\nabla g|^2 + |\mathcal{R} f|^2. $$

We assert the following:

**Suppose that** (12) **holds on** $B_2$. If $\nabla f(0) = \nabla g(0) \neq 0$, then $f = g$ on $B_2$.

**Proof.** By (12) and Lemma 11 there is a unitary operator $(\alpha_{ij})$ on $\mathbb{C}^3$ such that

$$(13) \quad \begin{pmatrix} D_1 f \\ D_2 f \\ \mathcal{R} g \end{pmatrix} = \begin{pmatrix} \alpha_{11} & \alpha_{12} & \alpha_{13} \\ \alpha_{21} & \alpha_{22} & \alpha_{23} \\ \alpha_{31} & \alpha_{32} & \alpha_{33} \end{pmatrix} \begin{pmatrix} D_1 g \\ D_2 g \\ \mathcal{R} f \end{pmatrix}. $$
Assume that $\nabla f(0) = \nabla g(0) = (1, 0)$ without loss of generality. Then, evaluating both sides of (13) at the origin, one can easily find that $\alpha_{11} = 1$ and $\alpha_{12} = \alpha_{13} = \alpha_{21} = \alpha_{31} = 0$. It follows that $D_1 f = D_1 g$. Hence $D_2 f - D_2 g$ does not depend on $z_1$-variable. In order to prove $D_2 f = D_2 g$ it is therefore sufficient to show that $D_2 f(0, z_2) = D_2 g(0, z_2)$ for $|z_2| < 1$. Evaluating both sides of (12) at points $(0, z_2)$, we obtain that $|D_2 f(0, z_2)| = |D_2 g(0, z_2)|$ and thus there exists a unimodular constant $\lambda$ such that

$$D_2 f(0, z_2) = \lambda D_2 g(0, z_2)$$

for $|z_2| < 1$. Assume that both sides of (14) are not identically zero; otherwise we are done. By (13),

$$z_2 D_2 g(0, z_2) = \alpha_{32} D_2 g(0, z_2) + \alpha_{33} z_2 D_2 f(0, z_2).$$

Insert (14) into the above. A little manipulation yields $\alpha_{32} = \alpha_{33} = 0$ and $\alpha_{33} = \bar{\lambda}$. Thus, we have $R f = \lambda R g$. Evaluating both sides of this at points $(z_1, 0)$, we obtain $\lambda = 1$. The proof is complete. \qed

We now conclude the paper with another special case:

If $f_{\ell+1} = 0$ and $f_j \neq 0$ for some $1j\ell$ where $f_m$ denotes the $m$th degree term in the homogeneous expansion of $f$ on $B$, then (12) implies $f = \lambda g$ for some unimodular constant $\lambda$.

Thus, if there were counter examples, then there would be no “gap” in their homogeneous expansions.

**Proof.** First note that the invariant mean value property of $|f|^2 - |g|^2$ yields

$$\int_S |f_m|^2 \, d\sigma = \int_S |g_m|^2 \, d\sigma \quad (m = 1, 2, \ldots)$$

where $g_m$ denotes the $m$th degree term in the homogeneous expansion of $g$ on $B$. Hence $g_{\ell+1} = 0$ and $g_j \neq 0$ by hypothesis. Now, by Lemma 11 as before, there exists a unitary operator $U$ on $\mathbb{C}^{n+1}$ such that $(\nabla f, R g) = U \circ (\nabla g, R f)$. In particular, there are some vectors $\alpha, \beta \in \mathbb{C}^n$ and a constant $\lambda$ with $|\alpha|^2 + |\beta|^2 = |\alpha|^2 = 1$ such that

$$R f = \langle \nabla g, \alpha \rangle + \lambda R g \quad \text{and} \quad R g = \langle \nabla f, \beta \rangle + \bar{\lambda} R f.$$

If $|\lambda| = 1$, then $\alpha = \beta = 0$ and (15) shows $R f = \lambda R g$, hence $f = \lambda g$. So, we assume $|\lambda| < 1$ and derive a contradiction. Equate terms of the same degree in the homogeneous expansions of both sides of two equations of (15) to obtain

$$m f_m = \langle \nabla g_{m+1}, \alpha \rangle + \lambda m g_m \quad \text{and} \quad m g_m = \langle \nabla f_{m+1}, \beta \rangle + \bar{\lambda} m f_m,$$

so that

$$m(1 - |\lambda|^2) f_m = \langle \nabla g_{m+1}, \alpha \rangle + \lambda < \nabla f_{m+1}, \beta >$$

for $m = 1, 2, \ldots$. Since $f_{\ell+1} = g_{\ell+1} = 0$, the above shows that $f_m = g_m = 0$ for all $1m\ell$, which is a contradiction. The proof is complete. \qed
